No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a ligand of less than 6 kD that binds to a polypeptide containing the sequence GlyTyrGlyGlnProHisGlyGly (A) or an analogue that is the retro-inverso isomer of (A). The sequence A is an octapeptide motif from the prion protein (PrP). The ligands are identified by binding assays with the peptide (A) or peptides containing (A). The ligands are used for detecting prion proteins (or prions) in biological or environmental samples, e.g. for diagnosis, also for

                     By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                     measuring human gene expression in a sample derived from human heart (see ABA21535-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                The present invention relates to single exon
                                                                                                                                                                                            Claim 15;
                                                                                                                                                                                                                                  Single
                                                                                                                                                                                                                                                                                                                                                              21-SEP-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                           WO200186003-A2

                                                                                                                                                                             Complements of the 1230 open reduling traines derived from the 12014 occurred to included are a microarray comprising the novel set of probes; the novel set of probes which hybridise at high stringency to a concleic acid expressed in the human lung; measuring gene expression in a cample derived from human lung; measuring gene expression in a collection of detectably labeled nucleic acids derived from human lung comprising (a) contacting the array with carray; identifying exons in a eukaryotic genome, comprising contacting the eukaryote; and (b) detecting specific hybridisation of detectably confided nucleic acids from eukaryote lung mana, to a single exon probe, control of the eukaryote; and (b) detecting specific hybridisation of detectably confided nucleic acids from eukaryote lung mana, to a single exon probe, control of a probe is included in the above mentioned microarray; assigning exons to a single exon probe, comprising (a) identifying exons from genomic sequence by the method comprising (a) identifying exons from genomic sequence by the method comprising the exons in the expression of each of the exons in several crisues and/or cell types using hybridisation to a single exon confidence to the exons should be assigned to a single exon probe indicates that the exons should be assigned to a single exon probe indicates that confidence in the specification, or encoded by the probes/open reading frames (ORF). The probes are used for gene confidence in the specification, or encoded by the probes in man lung derived mana and for identifying exons in a gene, particularly cusing human lung derived mana and for the study of lung diseases conclumnary alternative pulmonary histographs. Lunghand of encoder's disease.

Confidence is a constant the specification, or encoded by the probes in the constant pulmonary disease.

Confidence is a constant pulmonary histographs. Sandorme, sancoldosis, pulmonary histographs. Sandorme, sancoldosis, pulmonary histographs. Sandorme, sancoldosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                               odorant receptor DORS9. The odorant genes and proteins, such as those provided by the invention, are useful as they aid in the study of the olfactory organ in mammals, as well as aiding the understanding of the link between odour recognition and behaviour in insects. They also enable the identification of compounds capable of activating and inhibiting the receptors, allow the control of pest populations via the use of alarm odour ligands and via the use of ligands which interfere with the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cc which modulate expression of these genes, and in methods to identify receptor binding partners. The Drosophila odorant receptor nucleic acids commany also be used to identify corresponding genes in other insects, cs such as those which damage crops or transmit disease. The odorant cc such as those which damage crops or transmit disease. The odorant cc activity, to identify binding partners, as antigens to raise antibodies, cc and in methods to modify insect behaviour. The proteins may be also be used in methods to modify insect behaviour. The proteins may be also complication of behaviour modification. Such methods may be used to study or modify insect behaviour in response to odorants such as pheromones. Modification of insect behaviour has a wide range of applications, such as in pest control (e.g., by disrupting the feeding or mating behaviours of pest species), or for enhancing plant contains the feeding pollination (by attracting pollinator species). Odorant receptor proteins and/or nucleotides may also be used to identify appetite suppressants, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequences AAB20901-B20949 represent Drosophila melanogaster odorant receptors. These proteins function as olfactory receptors, and are thought to be members of the G protein-coupled receptor (GPCR) superfamily, which is characterised by the presence of 7 (Transmembrane helices. Nucleic acids encoding the Drosophila odorant transmembrane helices. Nucleic acids encoding the Drosophila odorant

                                                                                                                                                                                                                                                                     The polypeptides are used to identify compounds which bind to the polypeptides. Polypucleotides of the invention are used as probes and primers, for sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polypeptides of the invention can be used to target drugs to a tumour, in assays to determine biological activity, to raise antibodies/elicit an immune response, to determine quantitative protein levels, as tissue markers, and to isolate receptors or ligands. Polypeptides of the invention may also be useful in treating platelet disorders, stem cell disorders, regenerating bone, cartilage, tendon, ligament and/or nerve tissue, wound healing, treating burns, promoting the proliferation, differentiation and survival of stem cells, as a contraceptive, treating osteoporosis and osteoarthritis, anaemia, and the proliferation of the proliferation of stem cells, as a contraceptive, treating osteoporosis and osteoarthritis, anaemia, and the proliferation of the proliferation differentiation and survival of stem cells is a contraceptive, treating osteoporosis and osteoarthritis, anaemia, and the proliferation differentiation and osteoarthritis, anaemia, and the proliferation of the proliferation differentiation and osteoarthritis, anaemia, and the proliferation differentia

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are
                        The present sequence represents a novel receptor, CMRF-35-H9, which binds immunoglobulin M (IgM). CMRF-35-H9, a CMRF-35-H9 extracellular domain peptide or a vector encoding these, can be used to modulate an immune response in a patient or to block or inhibit a humoral immune response in a patient. This is particularly useful in a patient who has or is about to receive a transplant. The CMRF-35-H9 receptor or extracellular
                                                                                                                                                                                                                  Claim
                                                                                                                                                                                                                                                                                        Human immunoglobulin M

A ligand/antigen construct that binds CMRF-35-H9 can be us to load a protective antigen or a stimulatory antigen into an antigen presenting cell. The level of CMRF-35-H9 in a patient sample can be determined to diagnose myeloid leukemia in a patient. An increased level of CMRF-35-H9 or decreased level of promyelocytic leukemia is diagnost of leukemia.
The present sequence represents a novel receptor, CMRR-35-H9, which binds immunoglobulin M (IgM). CMRR-35-H9, a CMRR-35-H9 extracellular domain peptide or a vector encoding these, can be used to modulate an immune response in a patient or to block or inhibit a humoral immune response in a patient. This is particularly useful in a patient who has or is about to receive a transplant. The CMRR-35-H9 receptor or extracellular domain binds to antibodies, which are then no longer free to bind to the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   transplant. A ligand/antigen construct that binds CMRF-35-H9 can be used to load a protective antigen or a stimulatory antigen into an antigen presenting cell. The level of CMRF-35-H9 in a patient sample can be determined to diagnose myeloid leukemia in a patient. An increased level of CMRF-35-H9 or decreased level of promyelocytic leukemia is diagnostic of leukemia.
Chimeric human Ab expression vectors are constructed by inserting the Ab heavy and light chain variable region-encoding cDNA isolated from hybridomas producing a mouse or rat monoclonal Ab reacting with the ganglioside GM2 respectively into an expression vector for use in animal cells which contains the human Ab heavy a light chain constant region-encoding cDNA. The expression vectors
                                                                                                                     Disclosure;
                                                                                                                                                 Humanised antibody specific for ganglioside GM2 - used for producing a cytocidal effect on cancers such as melanoma, neuroblastoma and glioma.
                                                                                                                                                                                                                   WPI; 1994-126857/16.

In contrast to mouse monoclonal Abs, the chimmeric human Abs will not cause anti-mouse Ig Ab prodn. in the patient's body but show a prolonged blood half-life, with a reduced frequency of adverse effects, so that it can be expected to be superior to mouse monoclonal Abs in the efficacy in the treatment of human cancer, for instance.
                                                                                                                                                                                                                    Mouse anti-GM2 monoclonal Ab KM-796 and KM-750 and rat KM-603 heavy and light chain sequences are given in AAQ45426-30.     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score
